### HOW TAG WORKS...

TAG provides a 100% stable di-peptide chemical structure strong enough to be mixed in water or other beverages without any degradation. TAG enables direct assimilation into the bloodstream without being broken down in the GI track. TAG is able to circulate throughout the body unaffected as a time release agent until every gram is infused into the muscle tissue (average time release as measured=14hrs!) TAG supplies over 98.9% (compared to regular L-Glutamine's 60%) of the critical amino acid pool needed by muscle cells to properly recover and rebuild larger stronger muscle fiber. TAG also has a secondary affect on controlling insulin response in the body to steady levels throughout the day which promotes a positive anabolic trigger and a positive nitrogen balance to open pathways for your body to build more muscle.
